

# ZULF DISCOVERS SOME NEW HUMAN NATURE ELEMENTS: PEACE REQUIRES PARTICIPATION AND INFLUENCING POLITICAL DECISIONS

ZULFIKAR MOINUDDIN AHMED

I have been promoting the idea for a while that certain sorts of measurements tell us something about *human nature* of a universal type. Some of these are extremely unexpected. The criteria that I have for determining these measures is that they have a certain statistical uniformity across the globe over large populations.

I will claim discovery of one of these today, the opinion that participation in the political process to influence decisions as a necessity for peace.

The mean over  $N = 15$  countries is

$$p = 83.33$$

with standard deviation  $\sigma = 5.34$ . This is a very good human nature invariant. The dispersion is remarkably small for mean  $p = 83.33$ .

I am extremely interested in these sorts of invariants of human nature, because they tell us something about *our universal human nature*. And the fundamental reason for these is the genetic code in common  $G_c$  that allow us to have what seems like miraculous convergences in certain opinions and convictions that *a priori* would seem to be a matter of individual freedom. The convergences occur independently of any consensus.

This is a truly beautiful discovery because it highlights what many people would feel is some sort of political consensus. But in fact it is not. It is an expression of our universal human nature that is being expressed independently because these are not matters of consensus at all. These convergences express the natural moral nature encoded in our genome being expressed. This is why they occur invariant across languages, customs, ethnicities, and continents.
