

INFLUENCE OF SOME VARIABLES ON LIFE SATISFACTION

ZULFIKAR MOINUDDIN AHMED

1. NATIONAL PRIDE

National Pride has some influence on probability of high life satisfaction. Those with low national pride has probability of high life satisfaction $P_{lnp} = 65.56\%$ and those with high national pride have $P_{hnp} = 79.32\%$.

2. NO EFFECT FROM FEELING CLOSE TO THE WORLD

Life satisfaction probability given feeling close to the world is $P_{wc} = 77.46\%$ and that given not feeling close to the world is $P_{nwc} = 77.86\%$. This is almost identical. This is surprising to me but the variables are independent.

3. CIVIL RIGHTS ESSENTIAL PART OF DEMOCRACY

There is a mild improvement of those who believe civil rights are essential to democracy to those who do not. $P_{cre} = 79.3$ versus $P_{crne} = 75.62$.

It is not actually true that civil rights are essential to democracy at all objectively. This is a serious issue, for this had been thoroughly addressed in the foundation of United States of America. We have here a Multi-Ethnic Classical Liberal Democratic Republic. And our belief is that Governments are formed among men to secure Natural Rights of all people. This view, where the explicit foundations of the Government the purpose of securing Natural Rights is both correct and extremely badly handled by the actual United States Government. The vast spectrum of opinion in the human population on this question is a significant sign of confusion. This is not actually a matter of opinion, but of failure of governments to understand the serious nature of this question. In the United States most US Government officials are totally lost and confused about what their job is for this reason.
