

GDP CHANGE BY CONTINENTS 1995 TO 2018

The story of global growth from 1995 to 2018 by Continent tells you that advantage of Asia over others. People think only of a few countries when talking of growth. They talk about India and China; they talk about United States. But in fact growth is a massive thing and I have a summary from 117 countries that tell you the average growth from 1995 to 2018 a quarter of a century. Many many Asian countries are included, and this is equal weighted which is good because we want to get a sense of the countries as a whole.

	Continent	m
1	Af	1.19
2	As	1.64
3	E	1.21
4	O	0.83
5	SA	1.10
6	NA	0.66

That's a 23 year average for robustness. As you can see, average GDP growth of Europe has been 1.21% and Asia has been 1.64%. Asian growth is higher on average than everywhere else. And this is persistent, so all of Middle East will have higher growth in the end. This is not a new phenomena. Growth in Asia will continue to drive the global economic growth and not just in China.
