

SCIENTIFIC IDIOCY OF RACISTS

ZULFIKAR MOINUDDIN AHMED

1. BASIC FACT OF HUMAN MOLECULAR GENETICS

It is an extremely basic and well-known fact in molecular genetics today that human genome, of roughly 6 billion base pairs of DNA have an identity for all human beings in 99.9% of the locations. Only 0.1% of the snips (that's my lingo for SNP, single nucleotide polymorphism). You do not need to know a great deal of molecular genetics to become aware of this very elementary basic discovery that is well-known and well understood in molecular genetics. This is a fact that fifth graders can just learn across the globe without great difficulty.

2. INFERENCE FROM BASIC FACT

Scientific acumen is complex, but certainly it is clear that being able to make valid deductions and inferences from propositions is necessary for any scientific acumen. What is the inference to be drawn from the fact? It is that all aspects of Human Nature that have any genetic basis at all, which included morality, aesthetics, the ability to create vast sophisticated civilisations, and all that we can find admirable about the achievements of the past, to the extent they involve capabilities that are encoded in their genes, are independent of variation in the 0.1% of the human genetic code. To have any scientific sense we do not assign to 0.1% variation anything substantial at all because that is the principle of parsimony in science. It so happens that I have concrete results for ethnicity independence of Universal Human Moral Nature, bounding variation explained by ethnicity to 6.5-9.5%. So racists who want to assign great superiority of their ethnic tribe are scientific idiots, are not actually capable of scientific acumen worthy of a competent fifth grader, and frankly ought to be mocked for their idiocy until they change their ways.
