

## VAST DIFFERENCE BETWEEN SCIENCE AND MATHEMATICS

ZULFIKAR MOINUDDIN AHMED

The rift between Mathematics and Science is vast. It is so vast that people don't even understand just how vast it is. The difference is deep, and not superficial.

You see, mathematics, when it is deep, is deeply traditional. Originality is very important, but these things of mathematics, they have been refined over centuries and they are reworked and clarified, deeper and more subtle theorems are proven. There is always solid ground.

Science is at bottom always paranoid. There is always a question in science about whether *any of the concepts* are anything but sophistry, for the mystery of nature persists. There is at most agreement of a number of possibly deluded people. There are no actual 'black holes' in the universe, and there was never any 'big bang'. I overthrew those. They are fantasies of Man. And so in due time a Zulfikar Moinuddin Ahmed comes and upends the fantasy, and destroys the delusion of knowledge. Science is always like that. Mathematics is never like that.
