

# ZULF'S WAY OF HANDLING GLOBAL LIFE SATISFACTION

ZULFIKAR MOINUDDIN AHMED

Once it becomes crystal clear that web/mobile is the only way to provide services for increasing life satisfaction for eight billion, we proceed as follows.

We need to produce new hardware situations that cleanly handles eight billion users with fast page loads and responses. This cannot be done with clever tricks with EC2 etc. So 1000-2000 high quality 32 CPU rack servers in a San Francisco industrial space with several T1 lines with Mesos running the cluster and Nginx for HTTP servers running on all of them is the most canonical solution. I personally want this to be managed by Meteor Cloud but regardless, this is the best path forward, our own hardware or hardware controlled by folks who will give us extremely cost-efficient service with highest quality servers to all eight billion.

It does not matter whether we have clients or not. This is a good idea and ought to be funded immediately.

## 1. THE PSYCHOLOGY

We know from Positive Psychologists such as Marie-Rose Degg that 0.47 correlation exists between Life Satisfaction and Emotional-Spiritual Character Strengths like Hope and Gratitude.

There are quite a few works on these with leaders such as Robert Emmons and Martin Seligman. We want a situation where we can implement *their solutions* at scale with beautiful clean software with Meteor.

The difficult part of the approach is the evolution of doing this right at eight billion scale. That just takes time.

My approach is canonical and guaranteed to produce success in sufficiently long time. The result is a Global Life Satisfaction Revolution that will dwarf the PC Revolution of the 1970s.
